

PR #02 — Item Card Grid Documentation

Responsive layout, hover effects, Framer Motion animations

KM Rationale:

The card grid is the knowledge discovery interface. Each card surfaces the minimum information needed to decide relevance (image, type badge, title, location) without requiring the detail view — reducing the retrieval cost per query. Staggered animations signal that items are individual knowledge records loading progressively, not a monolithic list.

Description

Implements the item card grid inside `App.tsx`. Each card is a `motion.div` with staggered entry animations (Framer Motion), a hover lift effect (`shadow-lg + scale-[1.01]`), and responsive column layout (1 col mobile → 3 col lg). The card body renders:

- Image with Camera icon fallback
- Type badge (blue-700 for Lost, blue-200 for Found)
- Title (`line-clamp-1`)
- Description (`line-clamp-2`)
- Location with MapPin icon
- Formatted date with Calendar icon
- Author avatar (photo or initial fallback)
- Category badge

Clicking any card sets `selectedItem` state and opens the detail modal.

Files Changed

- `src/App.tsx` (card grid section added to `HomeView` render)

Commit Messages

- `feat(ux): implement item card grid with responsive columns and hover lift`
- `feat(ux): add Framer Motion staggered entry animation to card grid`
- `feat(ux): add image fallback, badge variants, and author avatar to cards`

Key Implementation Details:

Feature	Implementation
Grid layout	<code>grid-cols-1 sm:grid-cols-2 lg:grid-cols-3 gap-6</code>
Entry animation	<code>initial={{ opacity: 0, y: 20 }} animate={{ opacity: 1, y: 0 }}</code>
Stagger delay	<code>transition={{ delay: index * 0.04 }}</code>
Hover effect	<code>hover:shadow-lg hover:scale-[1.01] transition-all duration-300</code>
Exit animation	<code>exit={{ opacity: 0, scale: 0.95 }}</code> wrapped in <code>AnimatePresence</code>
